

Suspension Technique Jointless hidden locking

Cross section

Most Louverlux aluminium louvers can also be installed seamlessly, i.e. the joints between the louvre panels are as invisible as possible.

In this case, the louvre panels are butted together with a half-lap all round and secured with connecting clips to maintain parallelism.

Jointless suspension is achieved using specially moulded support rails on which the grid panels are suspended. The louvers are specially notched all the way round.

The support rails are in turn secured using height-adjustable quick-release hangers.
